DOCUMENT-IDENTIFIER: US 4157390 A TITLE: Process for vaccine preparation

CLAIMS:

1. A process for the preparation of a <u>vaccine</u> for parenteral administraion to pregnant mammals as a means for reducing the incidence of neonatal diarrhoea, in which process K88a,b/adhesion factor of an enteropathogenic strain of E. coli is adsorbed from a cell-free aqueous solution onto erythrocytes possessing their natural surface characteristics, the ratio of adsorbed K88a,b/adhesion factor to the volume of erythrocytes present being in the range 125 to 800 hemagglutination units per ml, and the composition so formed is rendered storable by the addition thereto of a preservative such as sodium <u>azide</u> or formalin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         genes.";
submitted (AUG-1999) to the EMBL/Genbank/DDBJ databases.
-!- FUNCTION: THIS PROTEIN PROMOTES THE GTP-DEPENDENT BINDING OF
AMINOACYL-TRNA TO THE A-SITE OF RIBOSOMES DURING PROTEIN
BIOSYNTHESIS (BY SIMILARITY).
-!- SUBCELULAR LOCATION: CHLOROPLAST (BY SIMILARITY).
-!- SIMILARITY: BELONG TO THE GTP-BINDING ELONGATION FACTOR FAMILY.

C;Function:
C;Function:
C;Function:
C;Superfamily: translation elongation factor Tu; translation elongation factor Tu; or translation elongation factor Tu; translation elongation factor Tu; translation elongation factor Tu; translation elongation factor Tu;
C;Keywords: acetylated amino end; GTP binding; hydrolase; methylated amino acid; nucl;
C;Keywords: acetylated amino end; GTP binding; hydrolase; methylated amino acid; nucl;
C;S-26/Region: translation elongation factor Tu homology <FTU>
C;13-139/Region: cranslation elongation factor Tu homology <FTU>
C;13-139/Region: GTP-binding motif A (P-loop)
C;13-139/Region: GTP-binding SAK/L motif
C;Z-20/Modified site: acetylated amino end (Ser) (in mature form) #status experimental
C;Z-26,62,136,137,139,174/Binding site: Mg-GTP (Lys, Thr, Thr, Asn, Lys, Asp, Ser) #
C;S/Modified site: N6-methyllysine or N6,N6-dimethyllysine (Lys) (partial) #status e
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A; Wolecule type: DNA
